## WATER USE IN THE MISSISSIPPI GULF COAST COUNTIES, 1980

by J. A. Callahan

### ABSTRACT

The increase in population between 1975 and 1980 in the three Mississippi counties along the Gulf Coast has been accompanied by an increase in water use and the number of people served by public water-supply systems. Freshwater use increased from about 92.0 million gallons per day (Mgal/d) in 1975 to about 109 Mgal/d in 1980. In the same period, the number of people served by public water-supply systems increased from about 227,000 to nearly 253,000. Water use by public water-supply systems, all from ground-water sources, increased from about 27.6 Mgal/d to more than 31.3 Mgal/d, a gain of about 14 percent. Self-supplied industrial use of ground water decreased from about 18.4 to 17.7 Mgal/d, while the use of fresh surface water by self-supplied industries rose from about 42.3 to 56.1 Mgal/d. Industrial use of brackish surface water decreased from about 790 Mgal/d in 1975 to 660 Mgal/d in 1980.

### INTRODUCTION

This report presents information on water use by public, self-supplied industrial, and rural systems in 1980 in Jackson, Harrison, and Hancock Counties, on Mississippi's Gulf Coast (fig. 1). The data were collected by the U.S. Geological Survey as part of a continuing program, begun in 1973, in cooperation with the Bureau of Land and Water Resources, Mississippi Department of Natural Resources. For comparative purposes, similar data from 1975 are included.

### WATER SOURCES

Most public and rural water supplies in the three counties come from ground-water sources, and most industrial water supplies come from surface-water sources. Aquifers which supply water to wells in the area are, in order of decreasing depth and geologic age, the Pascagoula (Miocene), Graham Ferry (Pliocene), Citronelle (Pliocene-Pleistocene), and terrace and alluvial deposits (Pleistocene-Holocene). Quality of ground water is suitable for most uses, and it generally improves as the aquifers thicken and become progressively deeper to the west. Well depths range from 100 to 800 ft in Jackson County, and some wells in Hancock County exceed 2000 ft in depth.

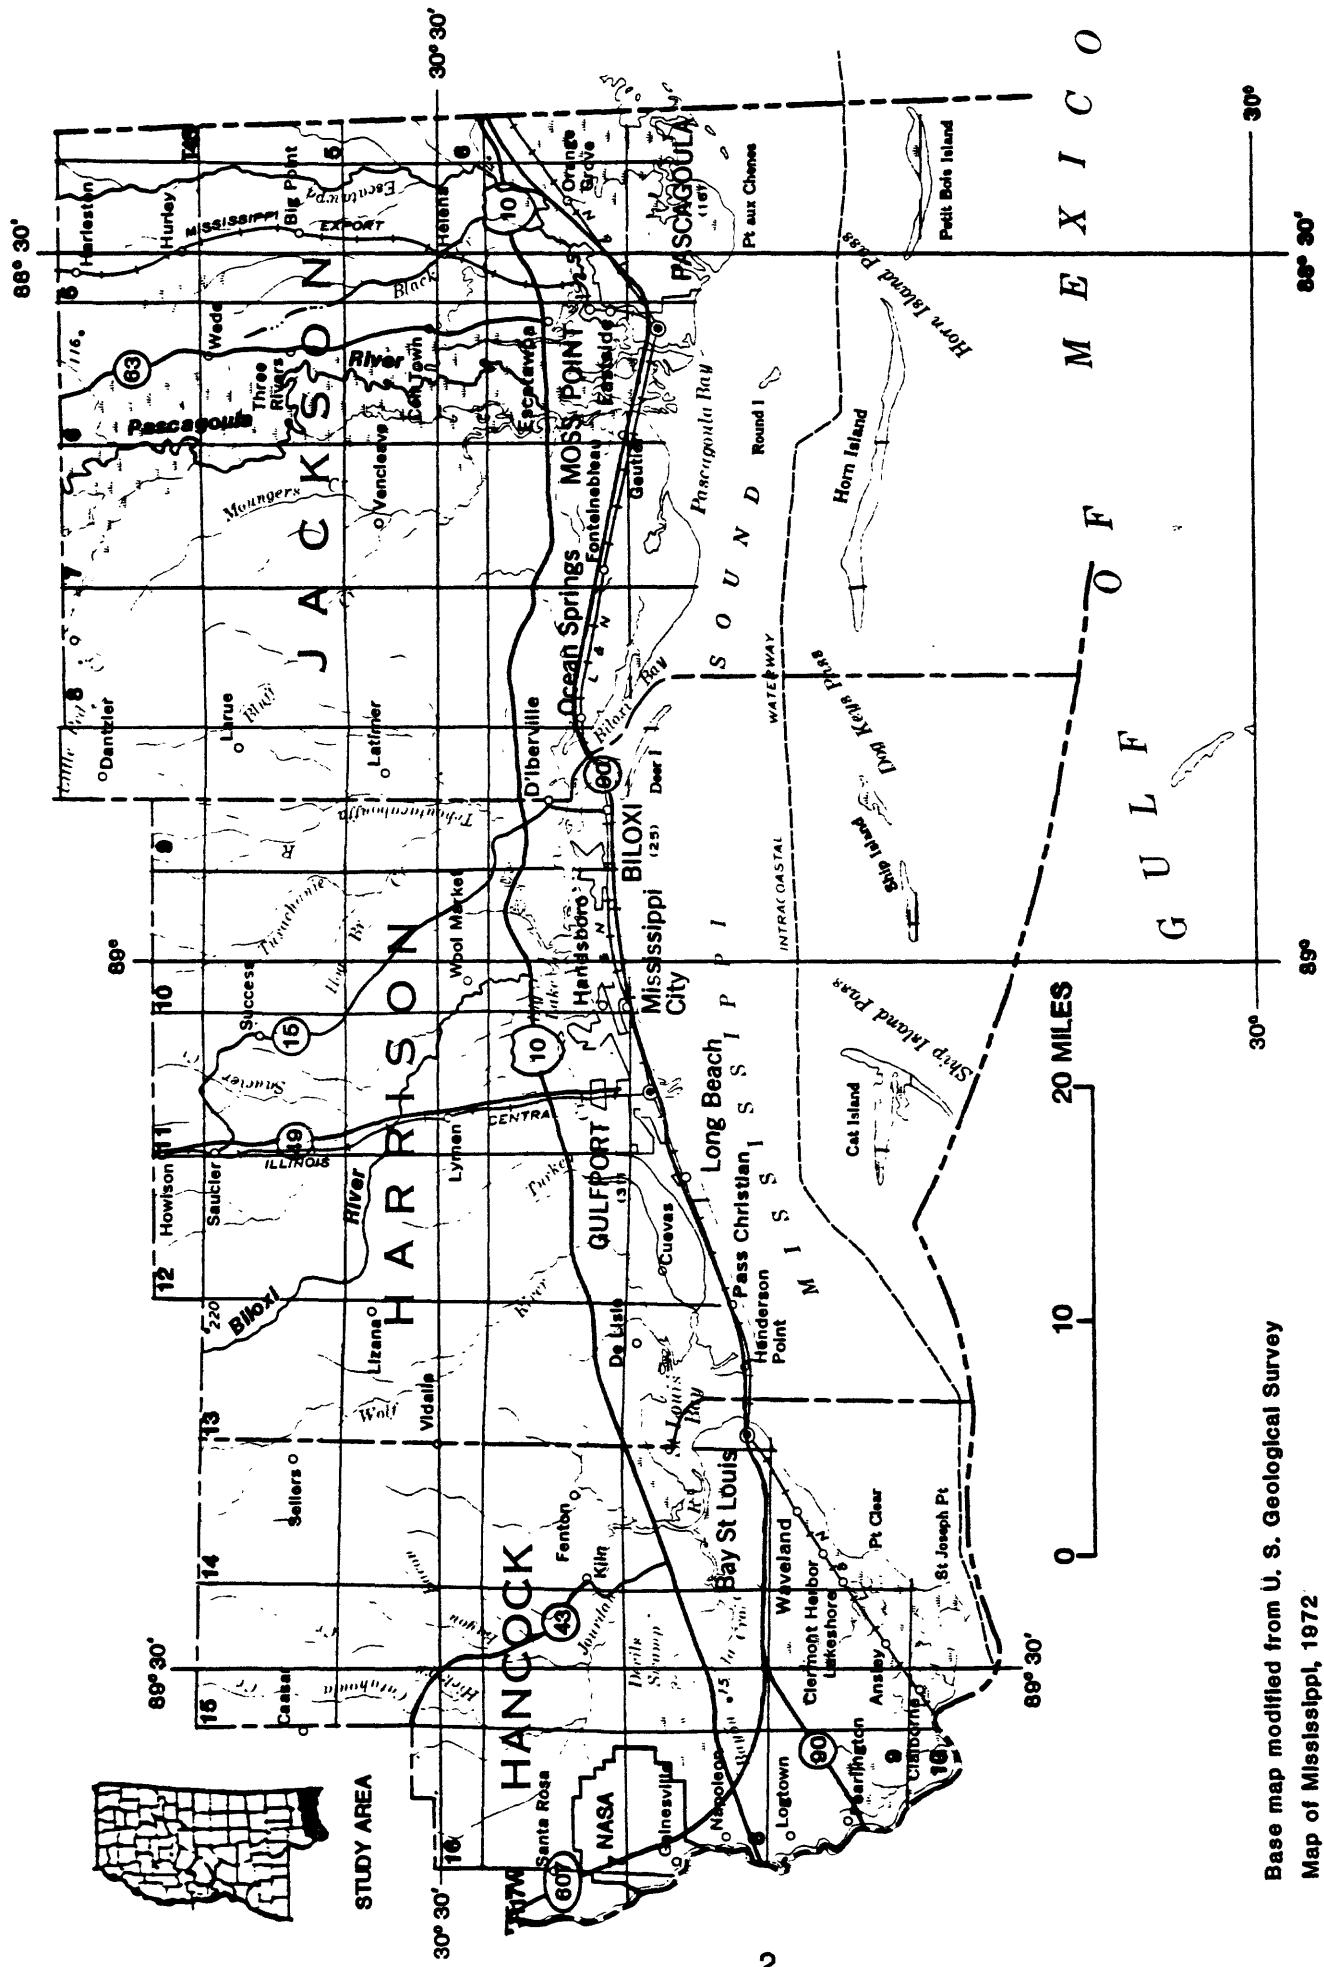

Figure 1.—MISSISSIPPI COASTAL COUNTIES

## WATER USE

### Jackson County

Water use in Jackson County in 1980 averaged about 238 million gallons per day (Mgal/d), of which almost 160 Mgal/d (67 percent) was brackish surface water used for industrial purposes, and about 78 Mgal/d was freshwater (table 1). Fresh surface water, essentially all of it used by industry, accounted for about 56.1 Mgal/d (72 percent) of all freshwater used in the county. Ground-water use amounted to about 22.0 Mgal/d, of which 10.5 Mgal/d (48 percent), was used by customers of the various public supply systems.

The population served by public water systems in the county increased about 5 percent between 1975 and 1980, and potable water use increased about 18 percent. This represents a gain of 13 percent in per capita use. Self-supplied industries in the Pascagoula-Moss Point area used 4.7 Mgal/d of ground water and 25.6 Mgal/d of surface water in 1980; both figures were down slightly from 1975. These firms include paper mills, ship builders, chemical companies, fish meal and pet food manufacturers, and seafood processing and packaging plants. The Mississippi Power Company's new coal-fired generating plant, Plant Daniel, 5 miles north of Escatawpa, obtains its cooling water from on-site reservoirs supplied with water from Black Creek by the Jackson County Port Authority. The station also supplies raw water to the treatment plant at Bayou Cassotte industrial complex, where several petrochemical, agri-chemical, and refractory industries are located. The growing industrial area at Gautier houses the Ingalls Ship Building Yards, the Jackson County Port Authority, docking facilities, and grain elevators.

### Harrison County

Water use in Harrison County in 1980 averaged about 528 Mgal/d, of which 502 Mgal/d (95 percent) was brackish surface water used for industrial purposes, and about 26 Mgal/d, virtually all of it ground water, was freshwater (table 2). About 19 Mgal/d (73 percent) of the ground water was used by public supply system customers.

Water used for public supply in the county increased from 1975 to 1980, but other categories of water use decreased in the same period. Biloxi is the home of Keesler Air Force Base, a Veterans Administration hospital, and light shipbuilding, steel, and other industries. Tourism and commercial fishing also contribute to Biloxi's economy. Gulfport has a high concentration of motels, commercial establishments, a Navy retirement home, a Veterans Administration hospital, and a Navy training base. The port is an important import-export center and is the banana importing point for the eastern United States. Gulfport Industrial Park houses chemical, steel, trailer manufacturing, and other plants.

### Hancock County

Water use in Hancock County in 1980 averaged about 4.8 Mgal/d. All water used was fresh; most was ground water, of which about 2.6 Mgal/d or 54 percent was used for industrial purposes and about 1.6 Mgal/d was used by public supply system customers (table 3).

Water used for all categories in the county increased between 1975 and 1980. The beach near Bay St. Louis and Waveland is a popular resort area, and businesses cater to summer residents and weekend visitors. Industrial use in the county is light, and the only self-supplied users are the government related industry at NASA Test Site and commercial fish production at Kiln.

### SUMMARY

The counties along the Mississippi Gulf Coast have experienced an increase in population since 1975, which is reflected in a corresponding increase in water use for some categories (table 4). The population served by public water systems increased from 226,655 in 1975 to 252,890 in 1980, a 12 percent change. A comparison of the 1975 and 1980 water use totals for the area is as follows:

			Percent
	<u>1975</u>	<u>1980</u>	<u>Change</u>
Public supplies	27.57 Mgal/d	31.30 Mgal/d	+14
Self-supplied industry			
ground water	18.42 Mgal/d	17.73 Mgal/d	- 4
fresh surface-water	42.35 Mgal/d	56.08 Mgal/d	+32
brackish surface-water	791.49 Mgal/d	661.69 Mgal/d	-16
Rural domestic	3.65 Mgal/d	3.64 Mgal/d	0

Water use in the three counties averaged about 770 Mgal/d in 1980, of which 86 percent was brackish surface water used for industrial purposes in Harrison and Jackson Counties (table 4). Freshwater use in the counties averaged about 109 Mgal/d. The largest use of fresh surface water, 56.1 Mgal/d, was for industrial purposes in Jackson County. The largest use of fresh ground water, 31.3 Mgal/d, in the three-county area was for public water supplies. The use of ground water in Harrison County, 25.8 Mgal/d, was slightly larger than that in Jackson County and about 5 times the amount used in Hancock County (fig. 2).

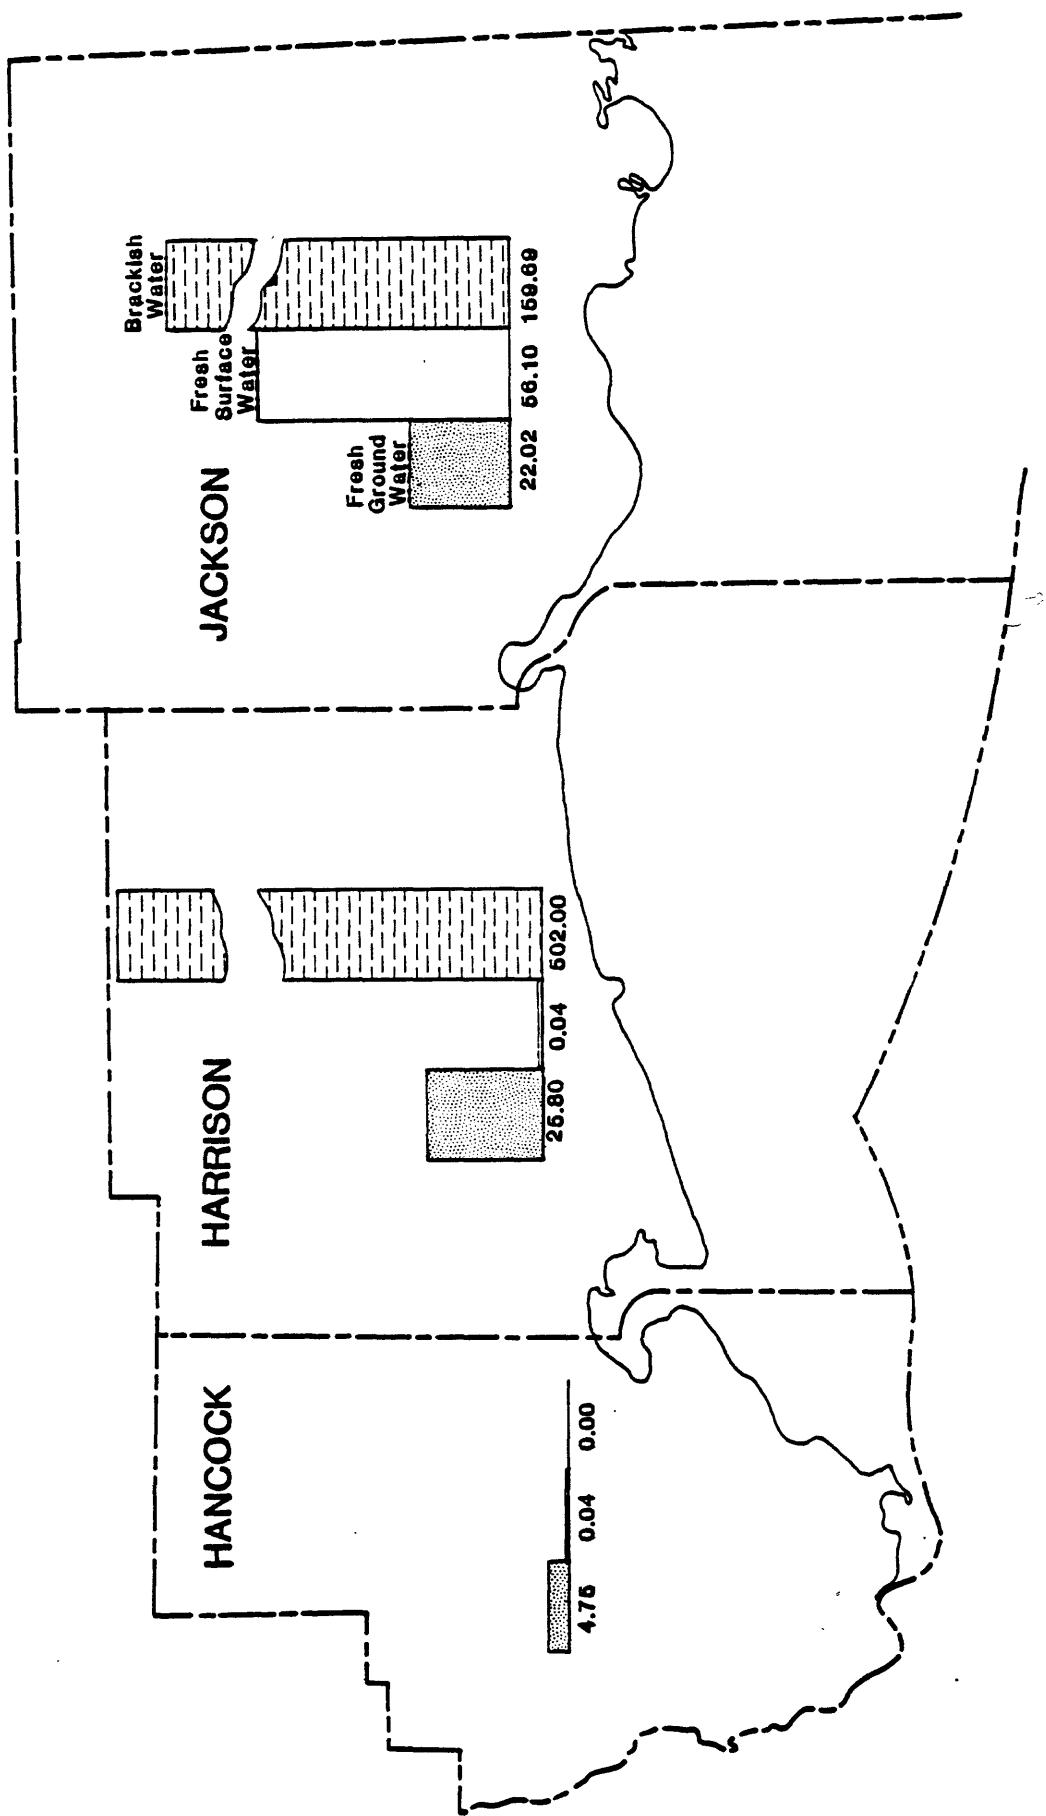

Figure 2.— Map showing water use in Hancock, Harrison, and Jackson counties, 1980, in million gallons per day.

Harrison County used the largest amount of brackish surface water of the three counties but used very little fresh surface water. Hancock County with a total water use of less than 5 Mgal/d, used very little water in comparison to Harrison and Jackson Counties.

The use of fresh ground water in the three county area increased about 6 percent between 1975 and 1980. The use of fresh surface water also increased during this period due largely to the increased industrial water use in Jackson County. The use of brackish water increased by about 100 Mgal/d in Jackson County between 1975 and 1980 but decreased by 231 Mgal/d in Harrison County.
